

Methodology of living standard survey sampling in the Republic of Tajikistan

Sampling for the living standard survey is in general to provide representativeness of the population therefore it was based on the number of population of the republic, urban and rural population i.e. specific gravity of the urban and rural population, and also administrative territorial division i.e. in oblast levels (see Appendix).

	Number of population as to Jan 1, 1998 (in thousand)			Number of population points (p/p)		
	Total	Urban	Rural	Total	Urban	Rural
Total: in Republic including:	6043,9	1629,4	4415,5	125	34	91
Dushanbe	509,3	509,3	-	11	11	-
RRS	1352,1	174,2	1177,9	27	3	24
Leninabad oblast	1850,4	525,1	1325,3	38	11	27
Khatlon oblast	2135,7	395,6	1740,1	44	8	36
Gorno Badakhshan	196,4	25,2	171,2	5	1	4

Sampling was done in two stages. At the first stage the number of territorial units (points) were selected so called initial units of sampling (IUS) in each oblast separately urban and rural population each village of Jamoat with the number of population and household was considered as the territorial unit of sampling.

The first stage of sampling consisted of the development of the sampling basis and the number of the population of the republic in towns, rayons, Jamoats, villages of Jamoat in each oblast were taken into consideration. Territorial units consists of a territory or administrative unit like rayons, towns and Jamoat-village in rural area. Selected units inspite of their characteristics are called initial units of sampling (IUS).

Initial units of sampling are the territorial units. Units of the second stage sampling are the households consisting of the number of households per on IUS that is 16 households.

It was necessary to select 125 population units in total all over the country i.e. IUS including 34 urban and 91 rural population units. The scheme of the sampling of the country is attached. Lists of the towns, rayons and within rayons (Jamoats—villages) were prepared manually, number of population was indicated then cumulative number of population was taken into consideration in each oblast separately, and then the initial territorial units were selected and al 125 population points from all over the country were selected including 34 IUS in urban areas and 91 IUS in rural areas, and in each IUS 16 households were selected which makes 2000 households, and out of them 544 households in urban areas and 1456 households in rural areas.

When the lists were made for each oblast separately for urban and rural areas in accordance with the selected population points or IUS the total cumulative number of population was calculated and further this number was divided in accordance with the selected population points which determines sampling interval then this sampling interval was calculated and the selection of population point or IUS was made, the same approach was used to all separate oblasts, urban and rural areas.

After the analysis of the sampling the actual aggregate selection of IUS to be covered by the survey was determined.

Units of the two-stage sampling consists of the households, containing the number of household for one IUS which is usually about 16 households. After dividing into different weighted analytical areas within the boundaries of each IUS, the two-stage sampling was made.

The second stage of the process of sampling always means field work i.e. on the spot it's a place of the collection of data which is called sampling and making the list of households to be covered by the survey.

Selection procedure of the household in urban areas within the IUS level. For the forthcoming census in 2000 the list of all houses in urban areas was made and on the basis of schematic plan of the urban population that is divided into districts (quarters), and there is a list of houses for each district. On the basis of these lists households were selected within each IUS.

For example: In Yavan a list of houses were made to select 16 households, there were 770 houses which were divided into 16 households that makes sampling interval – 48 houses then 16 households were selected. Sampling scheme is attached:

$$770: 16 = 48$$

Yavan Settlement

	Number of houses	Cumulative number of houses	Selected houses	Sampling interval
1. district	37	37	-	48
2. district	27	64	1	
3. district	42	106	1	
4. district	36	142	-	
5. district	33	175	1	
6. district	53	228	1	
7. district	26	254	1	
8. district	19	273	-	
9. district	45	318	1	
10. district	31	349	1	
11. district	35	384	1	
12. district	28	412	-	
13. district	23	435	1	
14. district	44	479	-	
15. district	9	488	1	
16. district	64	552	1	
17. district	66	618	1	
18. district	72	690	2	
19. district	80	770	2	
TOTAL		770		

On the basis of the selected houses the list of households with the address of the household and the location, and also the name of the owner was prepared.

In rural areas the selection of the households was made on the basis of the list of the population points of Jamoats—villages i.e. list of the villages within Jamoat with the indication of the number of households and number of population and the distance between the population point and the centre of Jamoat.

The sampling scheme of the rural areas is attached:
 2000: 16 = 125 sampling interval (SI)

Shaartuz rayon

Population point	Distance to the centre	Number of households (hh)	Number of population	Cumulative number of households	Number of selected hh
Jura Nazarov including villages:	30 km	2000	13250		
1. Lubyokor	-	398	2350	398	3
2. Tajikabad	6km	349	2086	747	2
3. Khoshadi	10km	297	1870	1044	3
4. Jamiyat dehon	6km	295	1893	1339	2
5. Aivaj	10km	661	5051	2000	6

Selection in rural areas was made on the basis of the administrative and economic activity accounting where each rural population point has the accounting—registration of each households, and also there are ordinal numbers for each household within Jamoat-village i.e. In accordance with the cumulative numbers of the households, the selected households' owners and their addresses are submitted to the supervisors and Jamoat representatives help to clarify and to find their location.

Furthermore the coding of population points and the households was done. In urban areas 38 population points were chosen i.e. codes from 001 to 038, and the codes of households from 0001 to 0608: in rural areas the population codes are from 039 to 140 and households codes are from 609 to 2400.
