Data structure of LSMS KAZAKSTAN

LSMS Kazakhstan consists of two different data sets:

1. Individual and household file (7224 individuals respective 1996 households)
2. Community file (135 cases)

1. Individual and household file

1.1. Structure of the data matrix

The cases of the LSMS data set are the individuals. Each record consists of two parts: Household data and individual data. Every member of a certain household has the same set of household variables.

The following variables are fundamental for the data handling:

RESPOND := unique identification number for every respondent

RN := identification variable for a household

PERSONNR := identification variable for an individual person in a household

NI := enumeration of interviewers, is equal to the PSU

Hence there is the following matrix structure:

Household Data		Individual Data	
RN	Household Variables	PNR	Individual Variables
1	all variables of household HH ₁	1	all individual variables of person 1 of HH ₁
1	all variables of household HH ₁	2	all individual variables of person 2 of HH ₁
1	all variables of household HH ₁	3	all individual variables of person 3 of HH ₁
2	all variables of household HH ₂	1	all individual variables of person 1 of HH ₂
2	all variables of household HH ₂	2	all individual variables of person 2 of HH ₂
...
2000	all variables of household HH ₂₀₀₀	1	all individual variables of person 1 of HH ₂₀₀₀
2000	all variables of household HH ₂₀₀₀	2	all individual variables of person 2 of HH ₂₀₀₀
2000	all variables of household HH ₂₀₀₀	3	all individual variables of person 3 of HH ₂₀₀₀
2000	all variables of household HH ₂₀₀₀	4	all individual variables of person 4 of HH ₂₀₀₀

The data file is organized as SPSS file. The pure household file can be produced by a simple step in SPSS:

Use in the **Data Window** the option **Select Cases**,
and then **PERSONNR=1**.

The resulting data matrix consists of different records, each presents the basic data of one household.

1.2. Correspondence of variables in the questionnaire and data matrix

The data matrix includes more than 1800 variables. Most of the variable names have a mnemotechnical syntax:

$\alpha x \beta_y_z$, where

α is a letter, which indicates the section of questionnaire
(in section EXPENCES more than one letter is used, see table 2)

β is a letter which indicates a subquestion (multiresponse set).

If there is no subquestion β will be skipped.

x is a number, which indicates the number of question

y is in the case of table questions the index of row

z is in case of table questions the index of column

(if no table, y respective z will be omitted).

Exceptions (special cases) are variables which shall indicate special scales, f. i. time, amounts of money (see chapter 1.3).

Following examples shall demonstrate how to read and how to identify the correspondence between variable names in the data set and the original item in the questionnaire:

Example 1: Simple standardized question (see page 5, question 4, section B)

4.	Do you have an official document certifying that this housing is owned by any member of your family?
	1 - yes
	2 - no
	<input type="checkbox"/> 5

That means:

$\alpha := B$

$x := 04$ and the name of variable is B04.

Example 2: Question with answers in tables (question 4, section D)

4. Did your household get any grants or allowances to children during the last 30 days? If yes, then how much?			
	Was your household paid ...?	yes - 1 no - 2 □ next line	How much in Tenge
1	a maternity grant	1	2
2	maintenance grant for babies under 3	3	4
3	maintenance grant for children from 3 to 18	5	6
4	single mother subsistence allowance	7	8

(continued)

Consequently, the name of the variable corresponding to cell 3 (row = 2, column = 1) is

D04_02_01

because: α := D
x := 04
y := 02
z := 01

If the number of alphanumerical digits is larger than 8, the _ will be omitted without loss of information, for instance in the case of A_09_14_15 we get A09_1415. The cause is the SPSS limitation of 8 digits for variable names.

1.3. Special Cases

Special kinds of variables (for instance time) will get a mnemotechnic ending of variable name. Following table gives an overview:

Table 1:

Typ of variable	Ending	Example
alphanumeric (text)	T	B02T
percent	P	W44_A_P
time (hours)	H	H_025_H
time (minutes)	M	H_025_M
amount of money in cash	X	D_040_X
percent of an amount in kind	Y	D_040_Y
special questions only for adults	W	AW017_
special questions for children	D	BD019_

Remark: The letter „W“ in adult questions points to the Russian word Wzroslye=adults, the analog is for „D“ Dety=children

2. Community file

2.1. Structure of the data matrix

- The cases of the data set are communities (municipal entities). In the case of rural locations, „posiolki“ (settlements) and small/medium sized towns every data record refers to one whole location.
- In cities there another situation: the general information (f. i. demographic information, economy and infrastructure) is available for the whole location, education and health care data are collected only for the city district of the PSU.

The following variables are fundamental for the data handling:

LOC_NR := number of locality
LOC := name of locality
TYP_LOC := type of locality
NI := enumeration of interviewers, is equal to the PSU

The rules for the determination of variable names are equivalent to the individual questionnaire.

2.2. Overview of sectors and corresponding variables

The following table 3 gives an overview of the sequence of sections and corresponding variables.

Table 3:
