### ABSTRACT

The Food and Agriculture Organization of the United Nations (FAO) has developed a monitoring system in 26 food crisis countries to better understand the impacts of various shocks on agricultural livelihoods, food security, and local value chains. The Monitoring System consists of primary data collected from households on a periodic basis (more or less every four months, depending on seasonality). A total of 2 507 households were reached during this tenth-round survey using the random digit dialing (RDD) method and a panel list of agricultural households that were surveyed in previous data collection rounds to reach the target. Data were weighted at the analytical stage to ensure that regional population distribution was adequately represented. Weights were computed based on population size and wealth proxies (education of the head of household and access to potable water).

## Sampling

### SAMPLING PROCEDURE

Initially, the sample was designed to include 110 households in each of the 22 governorates, amounting to a total of 2 420 households targeted nationally. This sample is representative of the population of Yemen and of the governorates at administrative level 1 with a 95 percent confidence level and a 10 percent margin of error. A total of 2 507 households were reached during this tenth-round survey using the random digit dialing (RDD) method and a panel list of agricultural households that were surveyed in previous data collection rounds to reach the target.

### WEIGHTING

Data were weighted at the analytical stage to ensure that the regional population distribution was adequately represented. Weights were computed based on population size and wealth proxies (education of the head of household and access to potable water).
